# 1 INTRODUCTION

RWDI USA LLC (RWDI) was retained by BRP Rhodochrosite 1, LLC to undertake a Solar Glare Hazard Assessment (SGHA) for the proposed Ebba Solar Project located in Lincoln County, Colorado. The aim of this analysis was to predict the potential for glare from the Project on nearby dwellings, flight paths and vehicle routes. All work was completed by qualified technical staff, as detailed in **Appendix A**.

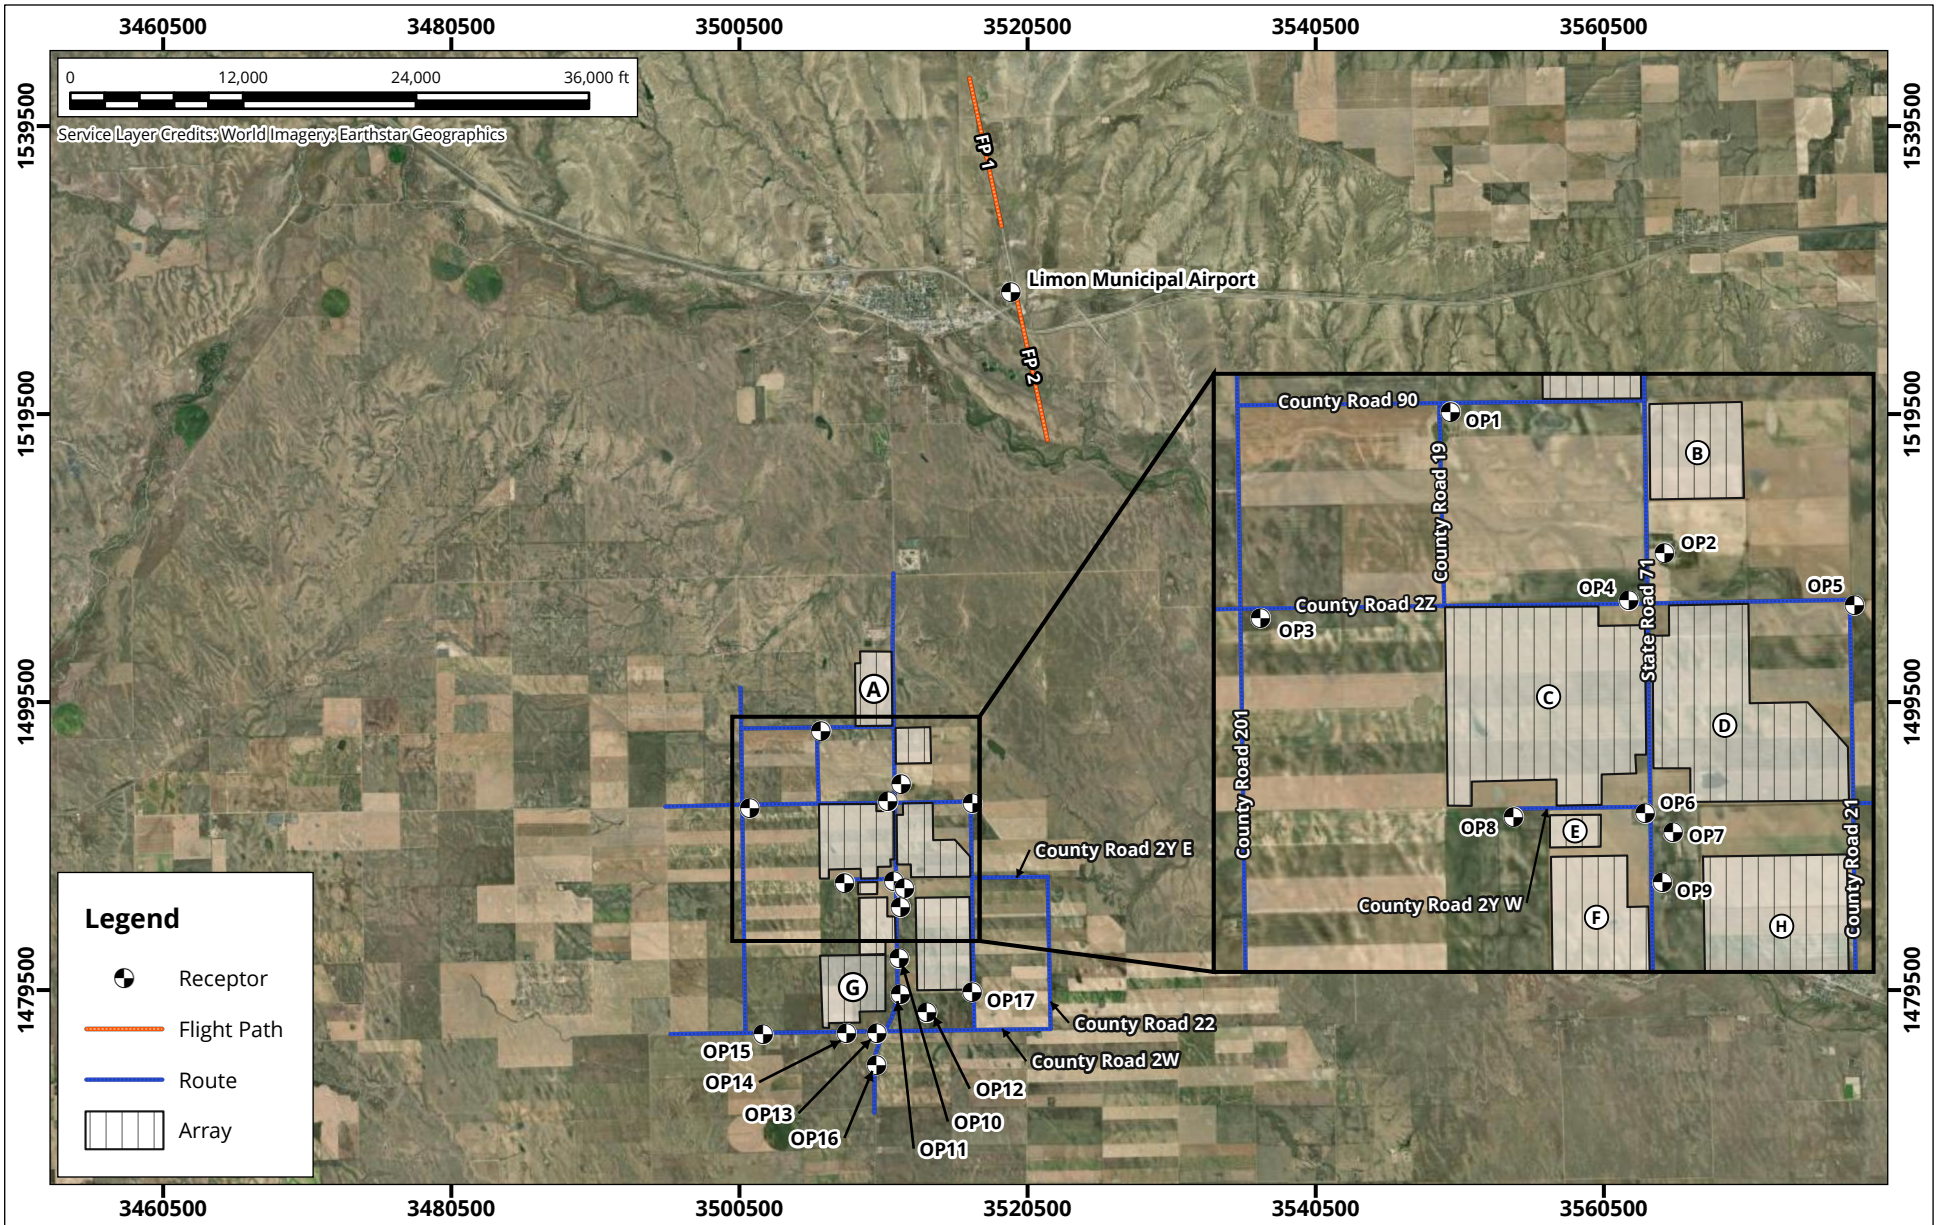

## 1.1 Objective and Regulatory Context

RWDI is not aware of specific requirements for glare from photovoltaics in Colorado. As such, we have based this assessment on standard industry best practices and RWDI's past experience in studying glare for hundreds of projects around the world. RWDI's assessment included:

- Predicting solar glare potential at any dwellings, railways, highways and other major roads within 5000 feet from the boundary of the project.
- Predicting solar glare potential at aerodromes, including the potential effect on runways, flightpaths, and air traffic control towers within 10 miles from the boundary of the project.
- Describing the time, location, duration, and intensity of solar glare predicted to be caused by the project.
- Describing the software or tools used in the assessment, the assumptions, and the input parameters utilized.
- Describing the qualification of the individual(s) performing the assessment.
- Producing a map (or maps) identifying the solar glare receptors, critical points along highways, major roadways and railways and aerodromes that were assessed.
- Producing a table that provides the expected intensity of solar glare (e.g., green, yellow, or red) and the expected duration of solar glare at each identified location.

# 2 PROJECT DESCRIPTION

The Project is a solar power plant that will have a grid capacity of 300 MW<sub>AC</sub> consisting of solar photovoltaic (PV) panels mounted on single-axis trackers covering approximately 4 square miles. Surrounding land use primarily consists of cultivated agricultural land and internal access roads. A map of the Project's layout, including the dwelling receptors and routes considered as part of this assessment, is included below in **Figure 1**.

## 3 METHODOLOGY

### 3.1 Overview

#### 3.1.1 Glare and Glint

Solar glare is defined as a continuous source of excessive brightness. This can be experienced by both stationary and moving observers. In common language, glint is a similar phenomenon but occurring over very brief timescales. In the interest of clarity, the word 'glare' will be used throughout this report.

There are many ways that glare can be classified [1], however the most commonly used metric for solar glare hazard assessment is the one created by Ho et al. [2] which categorizes glare into one of three ocular hazard color codes:

- **Green:** Glare with low potential to cause temporary afterimage (i.e., lingering image in a viewer's eye associated with a flash of light) to a viewer prior to a typical blink response time.
- **Yellow:** Glare with potential to cause temporary afterimage to a viewer prior to a typical blink response time.
- **Red:** Glare with potential to cause retinal damage to a viewer prior to a typical blink response time.

Below is a sample ocular hazard plot that illustrates where common sources of light approximately fall within this framework.

**Figure 2:** Ocular Hazard Plot

### 3.1.2 Reflectivity

The amount of visible light reflected from a solar panel depends on a variety of factors including the:

- latitude of the solar farm;
- time of year;
- solar intensity;
- presence of cloud, fog, dust or other attenuating factors in the atmosphere;
- angle of incidence at which direct sunlight strikes the panel; and
- overall reflectivity of the panel surface.

Solar panels are designed to maximize sunlight absorption and minimize reflection in order to ensure maximum electricity production. The majority of solar panels are treated with an anti-reflective coating (ARC) that further reduces the amount of sunlight that is reflected and was modelled as such in our analysis.

## **3.2 Identification of Receptors**

The locations investigated in this analysis were chosen based on RWDI's own best practices and experience in other jurisdictions to provide an appropriately conservative assessment of glare potential.

### **3.2.1 Dwellings**

All dwellings that exist within 5,000 feet of the Project was assessed in this study. A total of 17 dwellings were found within that radius (refer to **Figure 1**). These dwellings were studied at two different heights (5ft and 15ft above grade) to account for views at approximately the first and second floors.

### **3.2.2 Aerodromes**

Limon Municipal Airstrip was identified within a 10-mile radius of the project, to the north. Two flight paths, designated as FP1 (runway 16) and FP2 (runway 34), have been evaluated, representing departures/approaches to/from the north and south, respectively.

### **3.2.3 Routes**

Ten nearby routes were assessed in this analysis: County Road 19 (RR1), County Road 201 (RR2) are located to the west of project. County Road 21 (RR3), County Road 22 (RR4) are located to the east of project. County Road 2W (RR5), County Road 2Z (RR8), County Road 90 (RR9), and State Road 71 (RR10) pass through the project site. County Road 2Y also passes through the site, but based on Google Earth™ imagery it appears to be separated into two sections. For the purposes of this work, we have denoted these two sections as County Road 2Y E (RR6) and County Road 2Y W (RR7).

A summary of the receptors identified for the Project are presented in **Table 1** below.

**Table 1:** Project Route Receptors and Observation Points

Receptor ID	GlareGauge Receptor Type	Details
RR1	Route	County Road 19
RR2	Route	County Road 201
RR3	Route	County Road 21
RR4	Route	County Road 22
RR5	Route	County Road 2W
RR6	Route	County Road 2Y E
RR7	Route	County Road 2Y W
RR8	Route	County Road 2Z
RR9	Route	County Road 90
RR10	Route	State Road 71
FP1	Flight Path	Limon Municipal Airport Approaching from/Departing to the North
FP2	Flight Path	Limon Municipal Airport Approaching from/Departing to the South
OP1 – OP17 <sup>1</sup>	Observation Point	Dwellings in the vicinity of the Project

<sup>1</sup>All dwellings were studied at two different heights (5ft and 15ft above grade) to account for views at approximately the first and second floors. For the exact location of these dwellings, please refer to **Appendix B**.

### 3.3 Modelling Software

Solar glare from the proposed Project has been estimated using Forge Solar’s GlareGauge assessment tool. Assumptions and limitations associated with GlareGauge are described within Section 3.3.2. All work was completed by technical staff experienced in the assessment of reflected visible light and solar energy, as detailed in **Appendix A**.

### 3.3.1 Modelling Inputs

**Table 2:** Model Inputs

Parameter	Value	Input Type
<b>Axis Tracking</b>	Single axis	Project Specific
<b>Backtracking Method</b>	Shade-slope	Project Specific
<b>Tracking Axis Orientation</b>	180 Degrees (South)	Project Specific
<b>Maximum Tracking Angle</b>	60 Degrees	Project Specific
<b>Resting Angle</b>	11 Degrees	Project Specific
<b>Ground Coverage Ratio (GCR)</b>	30.37%	Project Specific
<b>Module Surface Material</b>	Smooth glass with ARC	Project Specific
<b>Rated Power</b>	300MW <sub>AC</sub>	Project Specific
<b>Heights Above Ground</b>	Solar panels: 5 ft	Project Specific
	Route Receptors (RR1-RR11): 3.5 ft	General
	Observation Points (OP): 5 ft and 15 ft	General
<b>View Angle for Routes</b>	50 Degrees	Default
<b>View Angle for Flight Paths</b>	30 Degrees (downward) 50 Degrees (azimuthal)	Default
<b>Glide Slope for Flight Paths</b>	3 Degrees	Default
<b>Eye Focal Length</b>	0.017 m	Default
<b>Sun Subtended Angle</b>	9.3 milliradians	Default

### **3.3.2 Model Assumptions and Limitations**

Assumptions and limitations of the analysis are listed below:

- This analysis was based on information provided to RWDI up to April 2, 2024. Design changes may impact the predictions made below. Should alterations occur, the details should be communicated to RWDI so that their impact on the conclusions be investigated.
- The SGHA did not include detailed geometry of the PV panels such as gaps between the modules and as such actual glare results may be impacted.
- The SGHA assumes that the PV panel arrays are aligned with a plane defined by the heights and coordinates from Google Maps. Large, localized changes in topography cannot be directly accounted for using this method.
- The model does not account for potential screening from natural or artificial obstacles such as cloud cover, vegetation or other physical obstructions including the building envelope of any dwellings.
- The model presents results for 1-minute intervals, but vehicle drivers would travel through a particular section of road relatively quickly. As such, if glare was to occur, it would result in momentary glint rather than continuous glare being observed for a driver.
- Based on information provided to RWDI, the PV arrays consist of single axis tracking panels and the module surface material was a smooth glass with an anti-reflective coating (ARC).
- RWDI has assumed a modern backtracking approach designed to minimize panel shading at low solar elevations.
- This analysis covers the expected typical operating condition of the Project. It does not include an assessment of glare potential during maintenance or other activities that would impact panel orientation. It is assumed that such activities would not occur for prolonged periods and would not affect a large portion of the Project at any one time.
- All receptor locations were based on Google Earth imagery of the project location and were not field verified by RWDI.
- This analysis assumed reasonable and responsible behavior on the part of people in the vicinity of the Project. A reasonable and responsible person would not purposely look towards a bright reflection, purposely prolong their exposure to reflected light or heat, or otherwise intentionally try to cause discomfort/harm to themselves or others and/or damage to property.

## 4 RESULTS AND ANALYSIS

### 4.1 Assessment

The results of the analysis (summarized in **Table 3** below) predicted no potential for glare of any color at any of locations under the assumptions described above.

**Table 3:** Predicted Glare Impacts from Project

Receptor ID	GlareGauge Receptor Type	Green Glare (min/year)	Yellow Glare (min/year)	Red Glare (min/year)
RR1	Route	0	0	0
RR2	Route	0	0	0
RR3	Route	0	0	0
RR4	Route	0	0	0
RR5	Route	0	0	0
RR6	Route	0	0	0
RR7	Route	0	0	0
RR8	Route	0	0	0
RR9	Route	0	0	0
RR10	Route	0	0	0
FP1	Flight Path	0	0	0
FP2	Flight Path	0	0	0
OP1 - OP17	Observation Point	0	0	0

## 5 CONCLUSION

Based on the GlareGauge analysis, RWDI can draw the following conclusion:

1. The Ebba Solar Project was not predicted to create glare of any color at any of the studied receptor locations under the conditions assumed above.

## 7 GENERAL STATEMENT OF LIMITATIONS

This report entitled Ebba Solar Project – Solar Glare Hazard Assessment was prepared by RWDI USA LLC (“RWDI”) for BRP Rhodochrosite 1, LLC (“Client”). The findings and conclusions presented in this report have been prepared for the Client and are specific to the project described herein (“Project”). The conclusions and recommendations contained in this report are based on the information available to RWDI when this report was prepared.

Because the contents of this report may not reflect the final design of the Project or subsequent changes made after the date of this report, RWDI recommends that it be retained by Client during the final stages of the project to verify that the results and recommendations provided in this report have been correctly interpreted in the final design of the Project.

The conclusions and recommendations contained in this report have also been made for the specific purpose(s) set out herein. Should the Client or any other third party utilize the report and/or implement the conclusions and recommendations contained therein for any other purpose or project without the involvement of RWDI, the Client or such third party assumes any and all risk of any and all consequences arising from such use and RWDI accepts no responsibility for any liability, loss, or damage of any kind suffered by Client or any other third party arising therefrom.

Finally, it is imperative that the Client and/or any party relying on the conclusions and recommendations in this report carefully review the stated assumptions contained herein and to understand the different factors which may impact the conclusions and recommendations provided.

## PRACTITIONER BIOGRAPHIES

## **Ryan Danks, B.A.Sc., P.Eng. Technical Director/Associate Principal**

Ryan Danks specializes in creating tools and methodologies to predict how the built environment will interact with climate. From preventing dangerous solar glare to tracking germs through air ducts and understanding wind flow around the next generation of extremely large telescopes, Ryan's ability to understand and simulate multifaceted physical processes yields answers to even the most sophisticated questions. His process may be complex, but the outcome is simple: comfortable, sustainable spaces in and around our clients' structures and facilities. In addition to the impressive results he delivers for clients, Ryan helps us stay at the leading edge of building science through his contributions to our building-science R&D practice. Among other things, Ryan is the lead developer of our Climate-Aware Design Toolkit, which includes the Eclipse solar modeling engine and the Oasis thermal comfort estimator.

Ryan has experience in urban glare analysis, thermal comfort, daylight availability/shadow analysis internationally and is a registered Professional Engineer in both Ontario and Alberta. He is also a member of the International Building Performance Simulation Association (IBPSA) Canadian Chapter, Canada Green Building Council, Facade Tectonics Institute and frequently presents at conferences on solar issues and glare in the built environment.

## **Amir Ahmadi, M.A.Sc. Technical Coordinator**

Amir possesses a blend of technical expertise and applied science background. His adept communication skills and innovative problem-solving abilities enable him to effectively articulate the outcomes of his analyses into concise, actionable reports. He exhibits fluency across various facets of our solar practice, coupled with a multidisciplinary perspective that fosters seamless collaboration with colleagues and the delivery of valuable outcomes and insights for the clients.

The page features a decorative background with a large, light gray circular shape on the right side, partially overlapping a blue triangular shape on the left. A white curved line separates the two shapes.
